

## Drinking Water Reports

In recent years, the Town of Exeter has had several important reports and studies conducted on its water supply and water systems. These reports include:

2002 - Water System Evaluation Study, conducted by Camp Dresser & McKee. This study looked at the complete water system, making recommendations for various short and long term capital improvements.

2003 - Safe Yield Study. This study, funded by the Aquarion company, reviewed the safe yield of Exeter's system in the event of a future interconnection with another system.

2004 - Water Rights study. This study looks at various water rights within the Exeter system.

2010 - Water Supply Alternatives Study. This study, conducted by Weston & Sampson, was commissioned to review water supply alternatives based on the Town pursuing a different direction after voters disapproved the proposed surface water plant in the mid 2000's.

2011 - Water Efficiency and Management Plan - This plan, developed by Exeter Public Works and Weston & Sampson, reviews the approach and viability of integrated water management within the Town.
